**ABSTRACT:**

Obesity is still a global health problem in the 21st century, that carries a significant chronic burden and includes a number of co-morbidities. Bariatric surgery is a successful potential treatment for obese people. Iron deficiency is a common cause of anaemia and is a common adverse effect of bariatric surgery. This review helps to increase understanding of the processes of anaemia in the bariatric patient beyond iron deficiency and educate healthcare providers with intention of taking a more considered approach to anaemia in this population of patient.
