### Abstract:

Chronic renal disease, is a slow & progressive decline of kidney function. It is usually a result of a complication from another serious medical condition such as diabetes mellitus, high blood pressure or cardiovascular disease. But now days covid -19 also contribute to renal impairment .So the present review signifies in detail about chronic renal failure along with covid-19, their diagnosis technique & management. Chronic renal injury causes more toxic exposure or disease example as hypertension, diabetes mellitus and COVID 19, the patient who have a chronic renal failure they get elderly attention. The aim of this article is to summarise the pathophysiology and it's Numerous effects, on the renal system. The pharmacological treatment of chronic renal failure can slow it's progression to end stage renal disease (ESRD), however the therapies remain limited. If patient has kidney become several damaged, may need to treatment for dialysis and transplantation.
