### **ABSTRACT**

The prospective study to identify the anaesthesia related post-operative complications in patients in tertiary care hospitals. Anaesthesia results in variety of metabolic and endocrine responses and also shows that anaesthetic technique has little long-term effect on patient outcome. Here, we review the most topical aspects of anaesthetic management which may influence the post-operative outcomes. General anaesthetics are commonly used in major surgeries to achieve the depth of anaesthesia for surgery. Patients are being subjected to a variety of general anaesthetics, alone or in combination.
